

HOW TO GROW ROSEMARY

A fragrant, flavorful herb that's easy to grow and loves the sunshine!

ABOUT ROSEMARY

Rosemary is an evergreen herb with needle-like leaves and a wonderful aroma. It's drought-tolerant, deer-resistant, and perfect for gardens, containers, and borders. Great fresh or dried in cooking!

SUNLIGHT

Full sun
(at least 6–8 hours per day)

SOIL

Well-drained, sandy or rocky soil.
pH 6.0–7.0

WATER

Water deeply but infrequently. Allow soil to dry out between waterings. Drought tolerant once established.

TEMPERATURE

Prefers warm weather.
Hardy in zones 7–10.
Protect from hard freezes.

COMPANION PLANTS

Good with carrots, cabbage, beans, and sage.
Helps repel cabbage moths and carrot flies!

HOW TO GROW

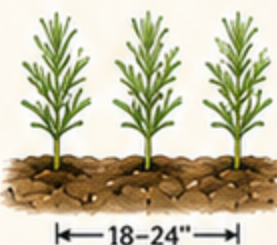

1 START FROM SEED

Start seeds indoors 6–8 weeks before last frost. Rosemary seeds germinate slowly and may take 2–4 weeks. Lightly cover seeds with soil.

2 TRANSPLANT

Set seedlings or young plants outside after the danger of frost. Space plants 18–24 inches apart. Rosemary prefers room to grow and good air circulation.

3 WATER & CARE

Water young plants regularly until established. Once established, water only when the soil is dry. Avoid overwatering.

4 PRUNE & MAINTAIN

Prune regularly to keep the plant bushy and healthy. Do not cut into the woody stems. Trim in spring or after flowering.

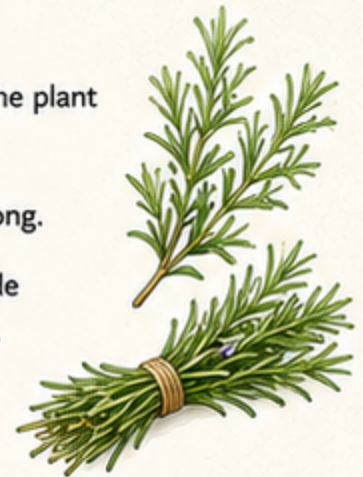

5 ENJOY!

Harvest sprigs anytime for cooking, to make teas, or for dried herb. The more you prune, the bushier your plant will grow!

HARVEST

- Harvest anytime after the plant is well established.
- Cut sprigs 4–6 inches long.
- Use fresh or hang upside down in bundles to dry.

USES

Adds savory flavor to meats, potatoes, roasted vegetables, soups, and breads.

Steep fresh or dried leaves in hot water for a calming tea.

Infuse in olive oil or vinegar for a delicious herb flavor.

TIPS FOR SUCCESS

- Plant in a raised bed or slope for best drainage.
- Mulch lightly—too much moisture can harm roots.
- Give plants plenty of space and good airflow.
